Description

Take a Hike, Kid! Is an app that incorporates family fun and exploration while encouraging families to explore the great outdoors. This app will offer feedback on parks and trails and opportunities for people to discover new places to take children.

Features

- To create a user profile and have the option to add park and trails listing for others to explore.
- To read information on various parks / trails.
- To rate parks and trails. Also add them to a "Favorites" section in the user's own profile.

Planning - User Stories

With the focus on parents finding parks for the whole family to enjoy, I utilized a story of a parent looking for hiking trails in the area to work on my project.

Planning - Database

Currently in the stage of the project, I am using a username and a password database. I have also implemented a parks database to connect with a trails database as well.

Technology Stack

- Java
- ThymeLeaf
- My SQL

Demo

What I Learned

- I learned that I still challenge myself in working individually with coding when i am still working on learning the material.
- Project management and how to manage the tasks and time of a project.

What's Next

- Finishing up the actual project
- Changing up the aesthetics of the app
- Wanting to get it deployed and able for people to use.
- Would like to make this an IOS app.
